

How different prompt count affects publish click

Admins only. **All buckets:** admins who saw preview at least once. **Last 30 days.** Source: BigBrain.

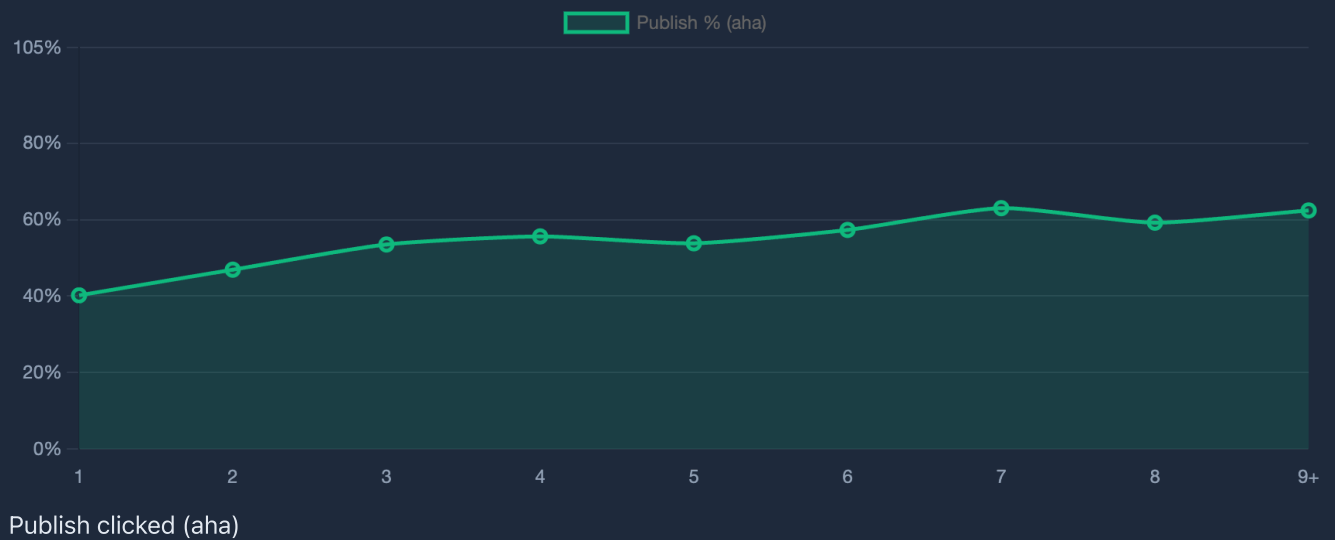

Unique admins: each admin is in exactly one segment (by number of prompts before first publish). No overlap between buckets.

Activation & aha moment by prompt segment

Segments 1–9+ (prompts before first publish). **Aha moment:** Publish click %. Last 30 days, admins who saw preview.

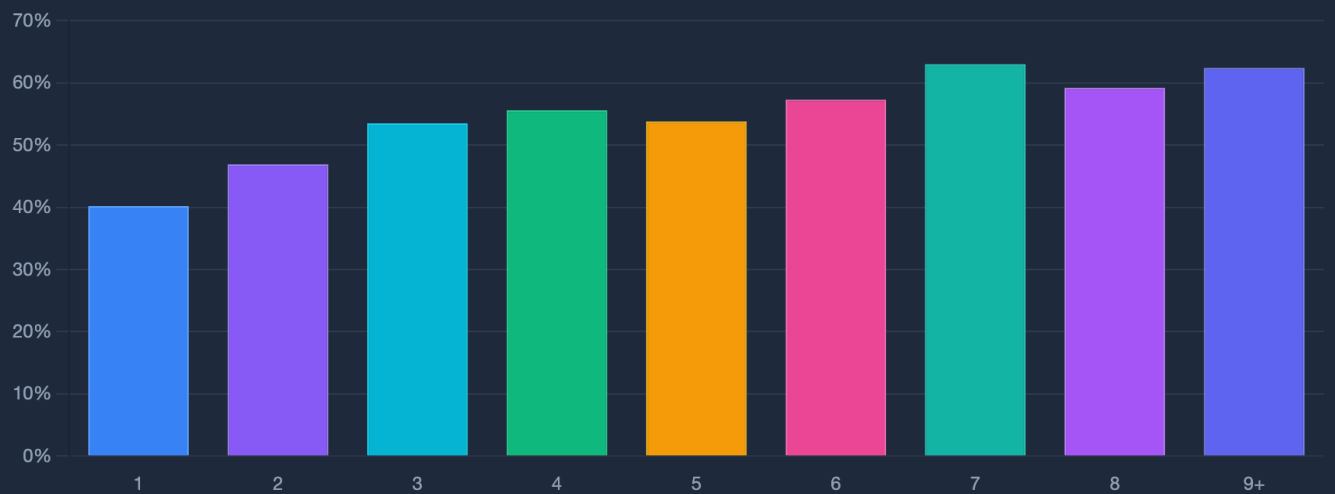

Proxy activation vs aha moment by segment

Main view: proxy success and aha probability across prompt segments.

Peak aha probability at 7 prompts (63%) and 9+ (62.4%). Proxy metrics near 100%; aha rises with prompts then plateaus.

Aha moment probability: Publish click % by segment

4-bucket view

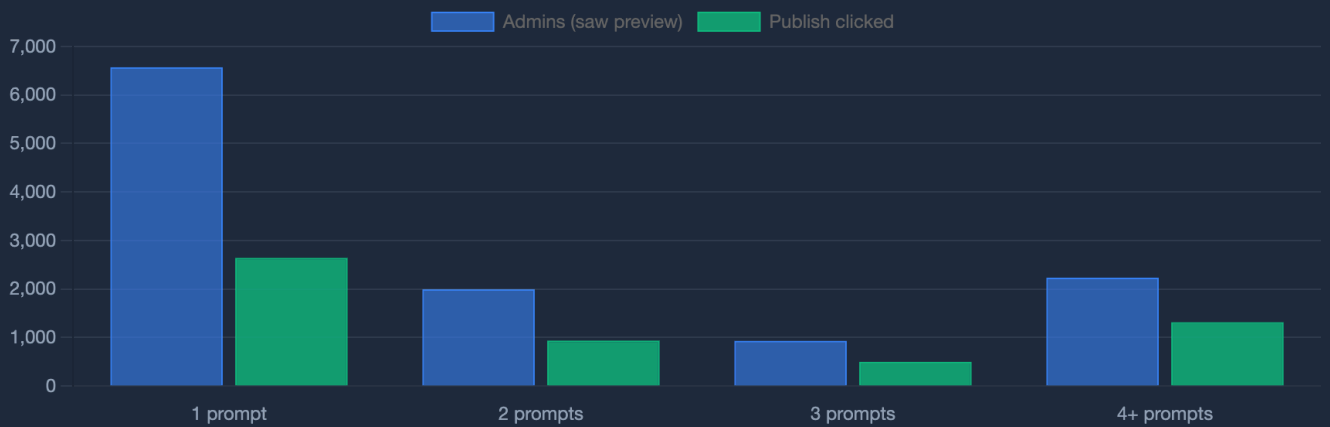

Prompt buckets: 1, 2, 3, 4+.

Publish click rate by number of prompts before publish

More prompts before first publish → higher publish click rate. 1 prompt: 40.2% → 4+ prompts: 58.9%. Peak at 4+ prompts (58.9%).

Users and publish clicks by prompt bucket

Summary table

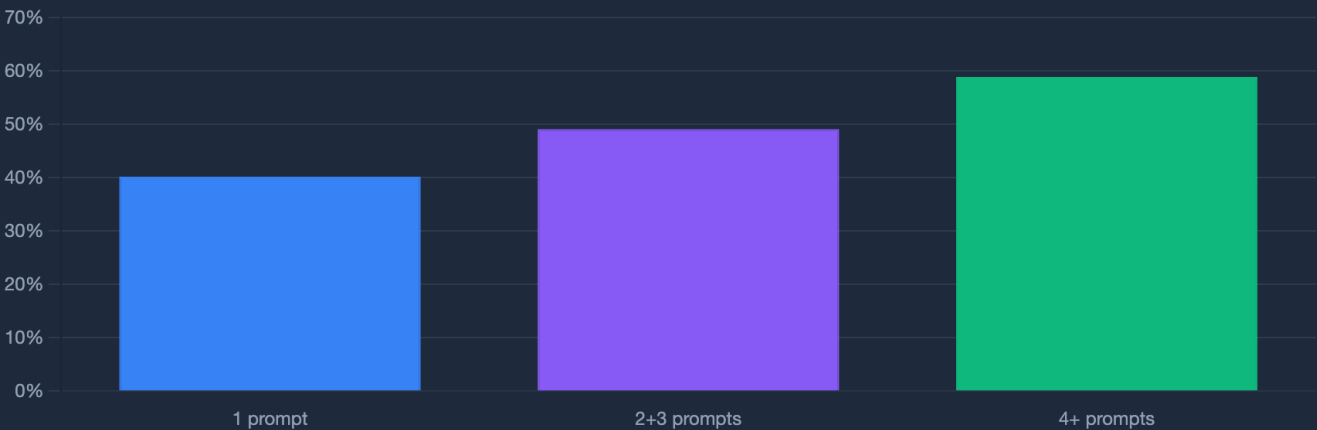

Prompts before publish	Admins (saw preview)	Publish clicked	Publish rate
1	6,571	2,641	40.2%
2	1,996	937	46.9%
3	931	499	53.6%
4+	2,234	1,315	58.9%

Validation: 6,571 + 1,996 + 931 + 2,234 = 11,734 unique admins (each in exactly one bucket).

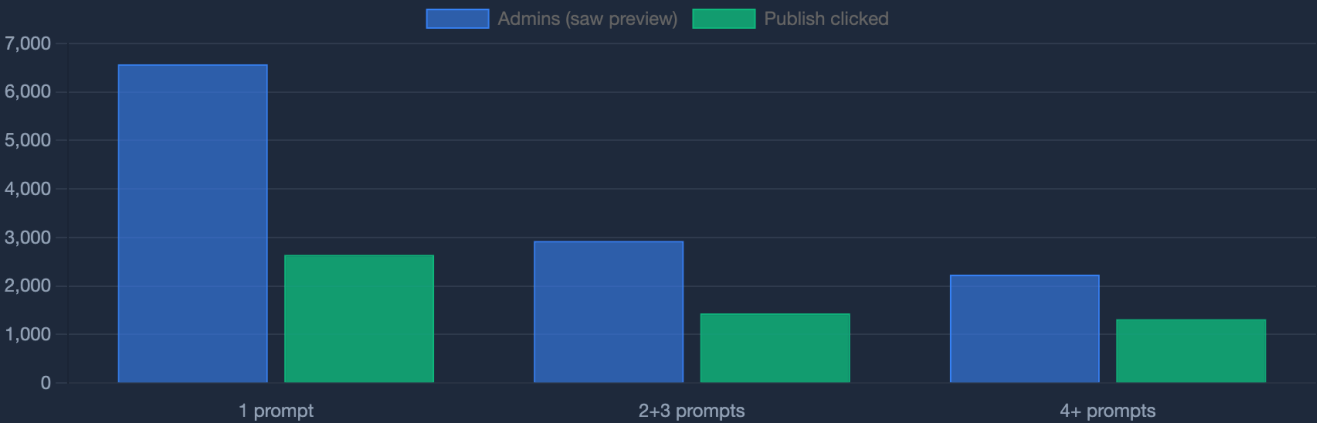

Combined view: 2+3 prompts

Same data with 2 and 3 prompts merged into one bucket.

Publish click rate (1 vs 2+3 vs 4+ prompts)

Users and publish clicks (combined view)

Summary table (combined)			
Prompts before publish	Admins (saw preview)	Publish clicked	Publish rate
1	6,571	2,641	40.2%
2+3	2,927	1,436	49.1%
4+	2,234	1,315	58.9%
